Product feature claims Original practice draft

A source check should begin with the exact claim that a document makes. Google Sheets provides an AI function that can generate text using a prompt and a referenced range. That capability does not mean every account or language is supported. The official help page describes the conditions and the generation workflow. Google Forms also documents a Help me create flow that can produce a quiz, answer keys, and point values. A writer should still inspect those keys before using the quiz with learners. Notion separates the workspace model controls for Notion Agent from the controls used by Custom Agents. A switch in one area should not be described as a personal model whitelist or as a setting for every kind of agent. These three statements need sources that support the specific scope, not just pages that mention the same product. I prefer to review original sources before improving the style of a draft. That last sentence is my preference, not a research finding. When a suggested link cannot be opened or does not support the claim, I leave the statement unresolved instead of inventing an author, date, paper, or DOI.
